EXAMINER	
GERSTL, SHANE F	

ART UNIT	PAPER NUMBER
2183	5

DATE MAILED: 12/11/2003

Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary	Application No.	Applicant(s)	
	09/752,573	SAMRA ET AL.	
	Examiner	Art Unit	
	Shane F Gerstl	2183	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

1)☒ Responsive to communication(s) filed on *30 March 2001 and 28 December 2000*.

2a)☐ This action is **FINAL**. 2b)☒ This action is non-final.

3)☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

4)☒ Claim(s) *1-23* is/are pending in the application.

4a) Of the above claim(s) _____ is/are withdrawn from consideration.

5)☐ Claim(s) _____ is/are allowed.

6)☒ Claim(s) *1-23* is/are rejected.

7)☒ Claim(s) *1,5-7,11,17-19, and 20* is/are objected to.

8)☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

9)☒ The specification is objected to by the Examiner.

10)☒ The drawing(s) filed on *30 March 2001* is/are: a)☐ accepted or b)☒ objected to by the Examiner.

Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).

Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).

11)☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. §§ 119 and 120

12)☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).

a)☐ All b)☐ Some * c)☐ None of:

1.☐ Certified copies of the priority documents have been received.

2.☐ Certified copies of the priority documents have been received in Application No. _____.

3.☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

13)☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. § 119(e) (to a provisional application) since a specific reference was included in the first sentence of the specification or in an Application Data Sheet. 37 CFR 1.78.

a) ☐ The translation of the foreign language provisional application has been received.

14)☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. §§ 120 and/or 121 since a specific reference was included in the first sentence of the specification or in an Application Data Sheet. 37 CFR 1.78.

Attachment(s)

1) ☒ Notice of References Cited (PTO-892)
2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
3) ☐ Information Disclosure Statement(s) (PTO-1449) Paper No(s) _____.
4) ☐ Interview Summary (PTO-413) Paper No(s). _____.
5) ☐ Notice of Informal Patent Application (PTO-152)
6) ☐ Other: .

DETAILED ACTION

1. Claims 1-23 have been examined.

Papers Received

2. Receipt is acknowledged of Declaration and Drawing papers submitted, where the papers have been placed of record in the file.

Specification

3. The disclosure is objected to because of the following informalities: the specification does not contain a summary of the invention. See MPEP § 1.73.

4. The title of the invention is not descriptive. A new title is required that is clearly indicative of the invention to which the claims are directed.

The following title is suggested: Filling a Trace Cache Based on Rename Resources Available.

5. The disclosure is objected to because of the following informalities: page 6, line 15 states the word "cach" but should be spelled "cache".

6. The disclosure is objected to because of the following informalities: page 10, line 17, mentions "sources or designations" and previously the phrase "sources and destinations" was used. The terminology should be kept consistent.

Appropriate correction is required.

Drawings

7. Figure 1 should be designated by a legend such as --Prior Art-- because only that which is old is illustrated. See MPEP § 608.02(g). A proposed drawing correction

or corrected drawings are required in reply to the Office action to avoid abandonment of the application. The objection to the drawings will not be held in abeyance.

8. The drawings are objected to under 37 CFR 1.83(a). The drawings must show every feature of the invention specified in the claims. Therefore, the trace cache initializer must be shown or the feature(s) canceled from the claim(s). No new matter should be entered.

A proposed drawing correction or corrected drawings are required in reply to the Office action to avoid abandonment of the application. The objection to the drawings will not be held in abeyance.

Claim Objections

9. Claim 1 is objected to because of the following informalities: line 1 states the limitation "superscalar" when the spelling should actually be "superscalar".

10. Claims 5-7 and 17-19 are objected to because of the following informalities: each claim makes reference to sources or destinations for renaming but they are only defined in claims 2, 3, 12, and 13. While it is generally known that register renaming includes destinations and sources and it is taken that the applicant is inferring the renaming resources to indicate such destinations and sources in the claims objected to, claims 2, 3, 12, and 13 make specific mention that the rename resources have destination and source parameters. Therefore, it is awkward that the claims in objection have no parent claim introducing the parameters. The examiner requests that the claims regarding destinations and sources be kept consistent with source and destination introduction so as to avoid all confusion.

11. Claim 11 is objected to because of the following informalities: line 1 gives the limitation "superscale" when the appropriate term is "superscalar".

12. Claim 20 is objected to because of the following informalities: it is unclear what the dynamic cache line size is. The examiner is taking the dynamic cache line size to be the size in terms of the number of renames that need to be performed in the line based on the progression into claim 23 and to be consistent with the other claims of this case. Also, line 2 mentions a "trace cache lien" when the appropriate phrase should be "trace cache line".

Appropriate correction is required.

Claim Rejections - 35 USC § 102

13. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

> A person shall be entitled to a patent unless –
>
> (e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

14. Claims 1-4, 8-10, 11-16, and 20-22 are rejected under 35 U.S.C. 102(e) as being anticipated by Keller (6,636,959).

15. In regard to claim 1, Keller discloses a method for processing instructions in a superscalar microprocessor (figure 1), comprising:

a. selecting an initial sequence of instructions for inclusion in a trace cache line; Column 5, lines 43-61, give a line predictor that functions as a trace cache.

It is inherent that there will be an initial sequence of instructions in the trace cache at some point since it is filled as shown in column 22, lines 62-column 23, line 2.

b. determining a set of rename resources needed for said trace cache line on a per-packet basis; Column 23, lines 22-27 show that a line is terminated when a maximum number of rename registers is reached. In order to determine that the maximum has been reached, it is inherent that the resources needed for the cache line must be determined.

c. adding one or more provisional instructions to said trace cache line to create a provisional trace cache line; Column 22, line 62 – column 23, line 2, show that a line predictor entry of instructions is created. This entry is then later added to the line predictor, upon termination, so before such adding is done, the entry is a provisional entry or provisional trace cache line.

d. repeating said determining step for said provisional trace cache line; Since, as shown in column 22, line 63 – column 23, line 2, the line is only terminated when a certain condition is met, the determining step must be repeated until a condition is met.

e. comparing said set of rename resources needed for said provisional trace cache line to a rename capacity; As described above, the line is terminated when the maximum register renames have been reached. This means that it is inherent that a comparison must have been done to see if the capacity would be exceeded be resources needed.

f. and accepting said one or more provisional instructions for inclusion in said trace line and repeating said adding step, or rejecting said one or more provisional instructions, based on said comparing step. Column 22, line 65 – column 23, line 2, shows that upon termination the entry is written to the line predictor. Thus the line predictor, or trace cache, accepts a provisional cache line.

16. In regard to claim 2, Keller discloses a method in accordance with claim 1, as described above, wherein: said set of rename resources needed and said rename capacity include a source parameter. Column 7, lines 22-27, show that the map (rename) unit renames both destination and source registers. Therefore, there is a source parameter of the rename capacity. Figure 9 and column 23, lines 24-27, shows that one of the conditions for line termination is that the maximum number of renames has been reached. Therefore the resources needed would include a source parameter to show such renames.

17. In regard to claim 3, Keller discloses a method in accordance with claim 1, as described above, wherein: said set of rename resources needed and said rename capacity include a destination parameter. Column 7, lines 22-27, show that the map (rename) unit renames both destination and source registers. Therefore, there is a destination parameter of the rename capacity. Figure 9 and column 23, lines 24-27, shows that one of the conditions for line termination is that the maximum number of renames has been reached. Therefore the resources needed would include a destination parameter to show such renames.

18. In regard to claim 4, Keller discloses a method in accordance with claim 1, wherein: said set of rename resources needed and said rename capacity include a line size parameter. Figure 9 shows a condition for line termination that includes the maximum number of instructions, which give the line size. Therefore, there is a line size parameter for resources needed and a capacity.

19. In regard to claim 8, Keller discloses a method in accordance with claim 1, as described above, wherein: selecting said initial sequence of instructions uses a worst case assumption of said set of rename resources needed. The examiner is taking the worst-case assumption to mean that the trace cache is filled initially with the number of instructions that would be the maximum number of instructions if the maximum number of dependencies were present as noted in the specification. As shown above, column 22, line 62 – column 23, line 2, describes that the line predictor entry is filled until a termination occurs. This means that the number of initially selected instructions in the line will at some point signify a worst case scenario and then will either be terminated or continue to be filled.

20. In regard to claim 9, Keller discloses a method in accordance with claim 1, as described above, wherein: selecting said initial sequence of instructions includes tabulating a maximum rename resource cumulative total based on a plurality of instruction types. As shown above, the number of rename resources needed is determined. This can be seen as tabulating a total because as shown, instructions are added based on resource availability until a maximum is reached, so a count must be kept to compare to the capacity. Once the line is filled, this total shows the maximum

for that line. Keller's disclosure allows for multiple instruction types as shown throughout.

21. In regard to claim 10, Keller discloses a method in accordance with claim 1, as described above, wherein: selecting a number of provisional instructions is performed based on a difference between said set of rename resources needed and said rename capacity. As shown above, instructions are added to the provisional line until a termination condition is encountered. These conditions include maximum the number of renames. Also as shown, the number of resources needed is determined and compared to the capacity. If there is a difference, the capacity has not been reached, and instructions are added. Thus the number of provisional instructions chosen, zero or another number, is based on the difference between resources needed and capacity.

22. In regard to claim 11, Keller discloses an apparatus for processing instructions in a superscalar microprocessor (figure 1), comprising:

a. an instruction stream with a plurality of instructions (column 2, line 30);

b. a trace cache line for receiving said instructions from said instructions stream; Column 5, lines 59-61 shows a line predictor which acts as a trace cache.

c. a packetized instruction resource calculator for determining a set of rename resources needed for said instructions in said trace cache line; Column 23, lines 22-27 show that a line is terminated when a maximum number of rename registers is reached. In order to determine that the maximum has been

reached, it is inherent that the resources needed for the cache line must be determined by resource calculating logic.

d. an instruction adder, responsive to said packetized instruction resource calculator, for adding one or more instructions to said trace cache line from said instruction stream while said set of rename resources needed is less than a rename resource capacity. Column 22, line 62 – column 23, line 2 shows that when a line is terminated, it is added to the line predictor, or trace cache. It is also shown that a line is terminated only on a condition given in figure 9. Thus, the line must be examined and added to as long as a condition is not met.

23. In regard to claim 12, Keller discloses an apparatus in accordance with claim 11, as described above, wherein: said set of rename resources needed includes a source parameter. Column 7, lines 22-27, show that the map (rename) unit renames both destination and source registers. Therefore, there is a source parameter of the rename capacity. Figure 9 and column 23, lines 24-27, shows that one of the conditions for line termination is that the maximum number of renames has been reached. Therefore the resources needed would include a source parameter to show such renames.

24. In regard to claim 13, Keller discloses an apparatus in accordance with claim 11, as described above, wherein: said set of rename resources needed and said rename capacity include a destination parameter. Column 7, lines 22-27, show that the map (rename) unit renames both destination and source registers. Therefore, there is a destination parameter of the rename capacity. Figure 9 and column 23, lines 24-27, shows that one of the conditions for line termination is that the maximum number of

renames has been reached. Therefore the resources needed would include a destination parameter to show such renames.

25. In regard to claim 14, Keller discloses an apparatus in accordance with claim 11, wherein: said set of rename resources needed and said rename capacity include a line size parameter. Figure 9 shows a condition for line termination that includes the maximum number of instructions, which give the line size. Therefore, there is a line size parameter for resources needed and a capacity.

26. In regard to claim 15, Keller discloses an apparatus in accordance with claim 14, as described above, wherein: said set of rename resources needed includes a source parameter. Column 7, lines 22-27, show that the map (rename) unit renames both destination and source registers. Therefore, there is a source parameter of the rename capacity. Figure 9 and column 23, lines 24-27, shows that one of the conditions for line termination is that the maximum number of renames has been reached. Therefore the resources needed would include a source parameter to show such renames.

27. In regard to claim 16, Keller discloses an apparatus in accordance with claim 15, as described above, wherein: said set of rename resources needed and said rename capacity include a destination parameter. Column 7, lines 22-27, show that the map (rename) unit renames both destination and source registers. Therefore, there is a destination parameter of the rename capacity. Figure 9 and column 23, lines 24-27, shows that one of the conditions for line termination is that the maximum number of renames has been reached. Therefore the resources needed would include a destination parameter to show such renames.

28. In regard to claim 20, Keller discloses an apparatus in accordance with claim 11, as described above, further comprising: a trace cache line initializer for initially loading said trace cache line with an initial number of instructions. It is inherent that there will be an initial sequence of instructions in the trace cache at some point.

29. In regard to claim 21, Keller discloses an apparatus in accordance with claim 20, as described above, wherein: said initial number of instructions is calculated as a fraction of said rename resource capacity. The examiner is taking the definition of a fraction to be a quotient of two quantities. Therefore, taking the initial number of instructions over said resource capacity will always be calculated as a fraction.

30. In regard to claim 22, Keller discloses a method of creating cache lines of instructions in a computer system, comprising:

a. determining the number of instructions in the cache lines using a packetization of instructions technique and a dynamic cache line size; The examiner is taking the dynamic cache line size to be the size in terms of the number of renames that need to be performed in the line based on the progression into claim 23 and to be consistent with the other claims of this case. Column 5, lines 59-61 shows a line predictor which acts as a trace cache. Column 22, line 62 – column 23, line 2 shows that a line is terminated on a condition. As shown in figure 9, there is a condition for when a maximum number of renames has been met. Thus in order to see if the condition of the maximum number has been met, the number of instructions that need to be renamed in the cache lines must be determined. Column 22, line 62 – column

23, line 2 also shows that instructions are added to the line predictor, or trace cache, when not terminated. Thus instructions are packed into the line.

b. matching said dynamic cache line size to a rename unit capacity. Figure 9 shows that there is a maximum number of renames that can be in a trace cache line. Thus it is inherent that this maximum number of renames condition checks for a match between the dynamic cache line size and the rename capacity.

Claim Rejections - 35 USC § 103

31. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

> (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

32. Claims 5-7, 17-19, and 23 are rejected under 35 U.S.C. 103(a) as being unpatentable over Keller in view of Moudgill.

33. In regard to claim 5,

a. Keller discloses a method in accordance with claim 1, as described above, wherein: determining a set of rename resources needed on a per packet basis. Keller has shown as described above that the line of instructions (a packet of instructions) has resources calculated for renaming.

b. Keller does not disclose that determining rename resources excludes destinations subsequently over-written within the packet from said set of rename resources needed.

c. Moudgill has disclosed that determining rename resources excludes destinations subsequently over-written within the packet from said set of rename resources needed. Figure 1 shows a set of instructions (a) and a renamed set of instructions (b). One can see that since destination r1 of line 1 is overwritten in line 3, the register r1 does not need to be renamed and thus it is determined that no rename resources are allocated for it.

d. It can easily be seen that by not renaming r1 of line 1, an additional register is not occupied, or it is saved, and can be used for later operations increasing flexibility. This flexibility would have motivated one of ordinary skill in the art to modify the design of Keller to determine the rename resources in the case of overwritten destinations as taught by Moudgill.

It would have been obvious to one of ordinary skill in the art at the time of invention to modify the design of Keller to determine rename resources excluding destinations subsequently overwritten within a packet of instructions as taught by Moudgill so that registers are saved allowing for more flexibility.

34. In regard to claim 6,

a. Keller discloses a method in accordance with claim 1, as described above, wherein: determining a set of rename resources needed on a per packet basis. Keller has shown as described above that the line of instructions (a packet of instructions) has resources calculated for renaming.

b. Keller does not disclose that determining rename resources excludes redundant sources within the packet from said set of rename resources needed.

c. Moudgill has disclosed that determining rename resources excludes redundant sources within the packet from said set of rename resources needed. Figure 1 shows a set of instructions (a) and a renamed set of instructions (b). One can see that source r3 of lines 1 and 2 are redundant sources because they refer to the same data. One can also see that these sources are not renamed. Thus it is determined that no rename resources are allocated for them.

d. It can easily be seen that by not renaming r3, additional registers are not occupied, or are saved, and can be used for later operations increasing flexibility. This flexibility would have motivated one of ordinary skill in the art to modify the design of Keller to determine the rename resources in the case of redundant sources as taught by Moudgill.

It would have been obvious to one of ordinary skill in the art at the time of invention to modify the design of Keller to determine rename resources excluding redundant sources within a packet of instructions as taught by Moudgill so that registers are saved allowing for more flexibility.

35. In regard to claim 7,

a. Keller discloses a method in accordance with claim 1, as described above, wherein: determining a set of rename resources needed on a per packet basis. Keller has shown as described above that the line of instructions (a packet of instructions) has resources calculated for renaming.

b. Keller does not disclose that determining rename resources excludes sources created within said trace cache line.

c. Moudgill has disclosed that determining rename resources excludes sources created within said trace cache line. Figure 1 shows a set of instructions (a) and a renamed set of instructions (b). One can see that source r1 is changed to source r9 in line 4 and therefore created in the cache line. One can also see that this source does not need a new register allocated to it, because the register has already been renamed in line 3 as the source there. Simply a designation for this register must be assigned. Thus it is determined that no rename resources are allocated for this source.

d. It can easily be seen that by not allocating rename resources for the source r9, additional hardware is saved. This savings in hardware would have motivated one of ordinary skill in the art to modify the design of Keller to determine the rename resources in the case of sources created within the trace cache line (packet) as taught by Moudgill.

It would have been obvious to one of ordinary skill in the art at the time of invention to modify the design of Keller to determine rename resources excluding sources created within the trace cache line (packet) as taught by Moudgill so that registers are saved allowing for more flexibility.

36. In regard to claim 17,

a. Keller discloses an apparatus in accordance with claim 11, as described above.

b. Keller does not disclose wherein: said packetized instruction resource calculator excludes destinations subsequently over-written within said trace cache line from said set of resources needed.

c. Moudgill has disclosed that said packetized instruction resource calculator excludes destinations subsequently over-written within said trace cache line from said set of resources needed. Figure 1 shows a set of instructions (a) and a renamed set of instructions (b). One can see that since destination r1 of line 1 is overwritten in line 3, the register r1 does not need to be renamed and thus it is determined that no rename resources are allocated for it.

d. It can easily be seen that by not renaming r1 of line 1, an additional register is not occupied, or it is saved, and can be used for later operations increasing flexibility. This flexibility would have motivated one of ordinary skill in the art to modify the design of Keller to determine the rename resources in the case of overwritten destinations as taught by Moudgill.

It would have been obvious to one of ordinary skill in the art at the time of invention to modify the design of Keller to determine rename resources excluding destinations subsequently overwritten within a packet of instructions as taught by Moudgill so that registers are saved allowing for more flexibility.

37. In regard to claim 18,

a. Keller discloses a method in accordance with claim 17, as described above.

b. Keller does not disclose wherein: said packetized instruction resource calculator excludes redundant sources with said trace cache line from said set of resources needed..

c. Moudgill has disclosed that said packetized instruction resource calculator excludes redundant sources with said trace cache line from said set of resources needed. Figure 1 shows a set of instructions (a) and a renamed set of instructions (b). One can see that source r3 of lines 1 and 2 are redundant sources because they refer to the same data. One can also see that these sources are not renamed. Thus it is determined that no rename resources are allocated for them.

d. It can easily be seen that by not renaming r3, additional registers are not occupied, or are saved, and can be used for later operations increasing flexibility. This flexibility would have motivated one of ordinary skill in the art to modify the design of Keller to determine the rename resources in the case of redundant sources as taught by Moudgill.

It would have been obvious to one of ordinary skill in the art at the time of invention to modify the design of Keller to determine rename resources excluding redundant sources within a packet of instructions as taught by Moudgill so that registers are saved allowing for more flexibility.

38. In regard to claim 19,

a. Keller discloses a method in accordance with claim 18, as described above.

b. Keller does not disclose wherein: said packetized instruction resource calculator excludes sources created within said trace cache line.

c. Moudgill has disclosed that said packetized instruction resource calculator excludes sources created within said trace cache line. Figure 1 shows a set of instructions (a) and a renamed set of instructions (b). One can see that source r1 is changed to source r9 in line 4 and therefore created in the cache line. One can also see that this source does not need a new register allocated to it, because the register has already been renamed in line 3 as the source there. Simply a designation for this register must be assigned. Thus it is determined that no rename resources are allocated for this source.

d. It can easily be seen that by not allocating rename resources for the source r9, additional hardware is saved. This savings in hardware would have motivated one of ordinary skill in the art to modify the design of Keller to determine the rename resources in the case of sources created within the trace cache line (packet) as taught by Moudgill.

It would have been obvious to one of ordinary skill in the art at the time of invention to modify the design of Keller to determine rename resources excluding sources created within the trace cache line (packet) as taught by Moudgill so that registers are saved allowing for more flexibility.

39. In regard to claim 23,

a. Keller discloses a method in accordance with claim 22, as described above.

b. Keller does not disclose wherein: matching said dynamic cache line size includes eliminating redundant register references within the cache lines.

c. Moudgill has disclosed that matching said dynamic cache line size includes eliminating redundant register references within the cache lines. Figure 1 shows a set of instructions (a) and a renamed set of instructions (b). One can see that source r3 of lines 1 and 2 are redundant sources because they refer to the same data. One can also see that these sources are not renamed. Thus it is determined that no rename resources are allocated for them and thus the line eliminates these sources from updating the line size, which indicates the number of renames.

d. It can easily be seen that by not renaming r3, additional registers are not occupied, or are saved, and can be used for later operations increasing flexibility. This flexibility would have motivated one of ordinary skill in the art to modify the design of Keller to eliminating redundant register references as taught by Moudgill.

It would have been obvious to one of ordinary skill in the art at the time of invention to modify the design of Keller to eliminating redundant register references as taught by Moudgill so that registers are saved allowing for more flexibility.

Conclusion

40. The following is text cited from 37 CFR 1.111(c): In amending in reply to a rejection of claims in an application or patent under reexamination, the applicant or patent owner must clearly point out the patentable novelty which he or she thinks the

claims present in view of the state of the art disclosed by the references cited or the objections made. The applicant or patent owner must also show how the amendments avoid such references or objections.

41. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. The following publications have been cited to further show the art with respect to trace caches and renaming in general:

Evaluation of Design Options for the Trace Cache Fetch Mechanism to Patel, Friendly, and Patt discloses a trace cache that is filled based on a set of general resources available.

Trace Cache: a Low Latency Approach to High Bandwidth Instruction Fetching to Rotenberg, Bennett, and Smith shows a trace cache with instruction limited trace lines.

Improving Superscalar Instruction Dispatch and Issue by Exploiting Dynamic Code Sequences to Vajapeyam and Mitra discloses a trace cache that has its lines record dependency information for quick internal resolution.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Shane F Gerstl whose telephone number is (703)305-7035. The examiner can normally be reached on M-F 6:45-4:15 (First Friday Off).
